

**django**

open `urls.py` of main project(mainpro)

paste the following Code:

```
from django.conf.urls import include, url
from django.contrib import admin
```

```
urlpatterns = [
    url(r'^admin/', admin.site.urls),
    url(r'^demo/', include('subpro.urls')),
]
```

make a new file with name `urls.py` in sub project(subpro)

paste the following Code:

```
from django.conf.urls import url
```

```
from . import views
```

```
urlpatterns = [
```

```
    url(r'^(?P<id>[0-9]+)/$', views.index1),
```

```
    url(r'^$', views.index),
```

```
]
```

Open `views.py` of sub project(subpro).paste the following Code:

```
from django.shortcuts import render
from django.http import HttpResponse
from .models import table1

def index(request):
    #return HttpResponse("</h1>HEEELLLOO<h1>")
    all_data=table1.objects.all()
    context={
        'all_data':all_data,
    }
    return render(request,'subpro/basic.html',context)
    #return render(request,'subpro/basic.html',{})

def index1(request,idd):

    #return HttpResponse("WELVCOME"+ str(idd))
    m1=table1.objects.get(pk=idd)
    return render(request,'subpro/basic.html',{'m1':m1,'idd':idd})
```

First make a folder with name templates in sub project. then again make another folder named with subpro inside templates folder.

```
<html>
<body>
<h1>hhhhhh</h1>
{{m1.id}}
<br>
{{m1.username}}

{% for a in all_data %}
    <a href="/demo/{{a.id}}/"> {{a.username}}<br>
{%endfor%}

</body>
</html>
```
